	Background: GBGT1 is a 347 amino acid single-pass type II membrane protein that belongs to
	the glycosyltransferase 6 family. Localizing to the golgi apparatus membrane, GBGT1 is widely
	expressed, with high levels found in placenta, ovary and peripheral blood leukocyte, and lower
	levels expressed in liver, thymus and testis. GBGT1 utilizes manganese as a cofactor, and
	assists in the addition of N-acetylgalactosamine (GalNAc) in alpha-1,3-linkage to various
	substrates, resulting in the formation of glycolipids. Glycolipids are present in most eukaryotic
	cells and may assist in the adherence of certain pathogens. Existing as two alternatively spliced
	isoforms, the gene encoding GBGT1 maps to human chromosome 9q34.2 and mouse
	chromosome 2 A3.
