	oligosaccharide glucosidase, Mogs, MOGS_HUMAN, Processing A glucosidase I, Processing A-		
	glucosidase I.		
	Background: Glycosylation of asparagine residues in Asn-X-Ser/Thr motifs in proteins		
	commonly occur in the lumen of the endoplasmic reticulum (ER). Glucosidase I catalyzes the		
	first step in the N-linked oligosaccharide processing pathway. It specifically removes the distal		
	alpha 1,2-linked glucose residue from the Glc3-Man9-GlcNAc2 oligosaccharide precursor.		
	Glucosidase I contains a short cytosolic tail, a single pass transmembrane domain and a large		
	C-terminal catalytic domain located on the luminal side of the ER. Mutations in the gene		
	encoding Glucosidase I result in the congenital disorder glycosylation (CDG-IIb), which is		
	characterized by generalized hypotonia, dysmorphic features, hepatomegaly, hypoventilation,		
	feeding problems, seizures and death. Two point mutations in the Glucosidase I gene have		
	been identified and result in amino acid substitutions, namely Arg486Thr and Phe652Leu, that		
	affect polypeptide folding and active site formation.
