	Glycine cleavage system protein H, Lipoic acid containing protein, mitochondrial, Mitochondrial
	glycine cleavage system H protein, NKH.
	Background: GCSH is a 173 amino acid mitochondrial protein that contains one lipoyl-binding
	domain and belongs to the gcvH family. Defects in the gene encoding GCSH are the cause of
	glycine encephalopathy (GCE), an autosomal recessive disease that is also referred to as non-
	ketotic hyperglycinemia (NKH). Characterized by severe neurological symptoms, patients with
	GCE have a large amount of glycine accumulated in their body fluids. The gene encoding GCSH
	maps to human chromosome 16, which encodes over 900 genes and comprises nearly 3 $\%$ of
	the human genome.
Gene ID:	2653
