	and differentiation of erythroid and megakaryocytic lineages. Transcriptional repressor or
	activator depending on both promoter and cell type context, represses promoter activity of
	SOCS1 and SOCS3 and thus, may regulate cytokine signaling pathways. Cooperates with
	GATA1 to repress target gene transcription, such as the apoptosis regulator BCL2L1, GFI1B
	silencing in leukemic cell lines markedly increase apoptosis rate. Inhibits down-regulation of
	MYC and MYB as well as the cyclin-dependent kinase inhibitor CDKN1A/P21WAF1 in IL6-
	treated myelomonocytic cells. Represses expression of GATA3 in T-cell lymphomas and
	inhibits GATA1-mediated transcription, as GATA1 also mediates erythroid GFI1B transcription,
	both GATA1 and GFI1B participate in a feedback regulatory pathway controlling the expression
	of GFI1B gene in erythroid cells. Suppresses GATA1-mediated stimulation of GFI1B promoter
	through protein interaction. Binds to gamma-satellite DNA and to its own promoter, auto-
	repressing its own expression. Alters histone methylation by recruiting histone
	methyltransferase to target genes promoters. Plays a role in heterochromatin formation.
