	Background: GFOD2 is a 385 amino acid secreted protein of the extracellular matrix that
	belongs to the gfo/idh/mocA family. Existing as two alternatively spliced isoforms, GFOD2
	enhances matrix assembly and is encoded by a gene that maps to human chromosome
	16q22.1. Chromosome 16 encodes over 900 genes and comprises nearly 3 $\%$ of the human
	genome. The GAN gene is located on chromosome 16 and, with mutation, may lead to giant
	axonal neuropathy, a nervous system disorder characterized by increasing malfunction with
	growth. The rare disorder Rubinstein-Taybi syndrome is also associated with chromosome 16,
	as is Crohn's disease, which is a gastrointestinal inflammatory condition.
