	HKR4, Protein HKR 4, Protein HKR4, Zinc finger protein GLI 4, Zinc finger protein GLI4.	
	Background: Zinc-finger proteins contain DNA-binding domains and have a wide variety of	
	functions, most of which encompass some form of transcriptional activation or repression. The	
	majority of zinc-finger proteins contain a krueppel-type DNA binding domain and a KRAB	
	domain, which is thought to interact with KAP1, thereby recruiting histone modifying proteins.	
	GLI-4, also known as HKR4, is a 376 amino acid protein that localizes to the nucleus and	
	contains seven C2H2-type zinc fingers. Belonging to the krueppel C2H2-type zinc-finger protein	
	family, GLI-4 may function as a transcriptional regulator, effectively activating or repressing the	
	transcription of target genes. The gene encoding GLI-4 maps to human chromosome 8, which	
	consists of nearly 146 million base pairs, houses more than 800 genes and is associated with a	
	variety of diseases and malignancies.	
Gene ID:	2738
