| | Background: The Golgi apparatus is a highly complex organelle comprised of a stack of |
| | cisternal membranes on the secretory pathway from the ER to the cell surface. The structure is |
| | maintained by an exoskeleton or Golgi matrix constructed from a family of coiled-coil protein, |
| | the golgins and other peripheral membrane components such as GRASP55 and GRASP65 (1). |
| | GRASP55 (Golgi reassembly stacking protien or p59) is a component of the Golgi stacking |
| | machinery. GRASP55 is highly homologous to GRASP65 and contains two PDZ domains. |
| | GRASP55 is myristoylated and palmitoylated. Unlike GRASP65, GRASP55 does not have |
| | detectable binding with the vesicle docking protein GM130 and is located on the medial-Golgi |
| | rather than cis-Golgi. Both GRASP55 and GRASP65 function in the stacking of Golgi Cisternae |
| | (2,3). The novel coiled-coil protein golgin 45 interacts with GRASP55 and the GTP form of Rab |
| | 2, suggesting that GRASP55 and golgin 45 form a Rab 2 effector complex on medial-Golgi |
| | essential for normal protein transport and Golgi structure (4). ERK2 directly phosphorylates |
| | GRASP55, which is phosphorylated in mitotic cells, suggesting that mitogen-activated protein |
| | kinase kinase (MKK)/ERK pathway phosphorylates the Golgi during mitosis (5). |
