Background:	Synonyms: H1F00_HUMAN, Histone H1oo, Oocyte-specic histone H1, Oocyte-specic linker
	histone H1, osH1, H1F00, H100, OSH1, H1F00 protein.
	Background: Histones are basic nuclear proteins that are responsible for the nucleosome
	structure of the chromosomal fiber in eukaryotes. Nucleosomes consist of approximately 146
	bp of DNA wrapped around a histone octamer composed of pairs of each of the four core
	histones (H2A, H2B, H3, and H4). The chromatin fiber is further compacted through the
	interaction of a linker histone, H1, with the DNA between the nucleosomes to form higher order
	chromatin structures. The protein encoded is a member of the histone H1 family. This gene
	contains introns, unlike most histone genes. The protein encoded is a member of the histone
	H1 family. The related mouse gene is expressed only in oocytes. [provided by RefSeq, Jul 2008].
