Target Details	
Background:	Synonyms: bHLHb40, Class B basic helix loop helix protein 40, Hairy and enhancer of split 2
	Drosophila, Transcription factor HES 2, HES2_HUMAN.
	Background: The Drosophila hairy and Enhancer of split genes encode basic helix-loop-helix
	(bHLH) transcriptional repressors that function in the Notch signaling pathway and control
	segmentation and neural development during embryogenesis. The mammalian homologues of
	Drosophila hairy and Enhancer of split are the HES gene family members, HES1-6, which also
	encode bHLH transcriptional repressors that regulate myogenesis and neurogenesis. The HES
	family members form a complex with TLE, the mammalian homologue of Groucho, and this
	interaction is mediated by the carboxy terminal WRPW motif of the HES proteins. The HES/TLE
	complex functions by directly binding to DNA, instead of interfering with activator proteins.
	Most HES family members, including HES1 and HES5, preferentially bind to the N box
	(CACNAG) as opposed to the E box (CANNTG). HES2 binds to both N and E box sites, while
	HES6 does not bind DNA. Rather, HES6 inhibits HES1 activity, thereby promoting transcription.
	HES1 and HES2 are expressed in a variety of adult and embryonic tissues. HES3 is expressed
	exclusively in cerebellar Purkinje cells, and HES5 is found solely in the nervous system. HES6 is
	produced in brain as well as in the limb buds of developing embryos.
