| Background: The LIN-12/Notch family of transmembrane receptors plays a central role in           |  |  |
| development by regulating cell fate and establishing boundaries of gene expression. Notch        |  |  |
| signaling activates the Hairy/Enhancer of split (HES) genes, which encode basic helix-loop-helix |  |  |
| (bHLH) transcriptional repressors that are critical for directing embryonic patterning and       |  |  |
| development. The Hairy-related transcription factors (HRTs) comprise a subclass of bHLH          |  |  |
| proteins that exhibit structural similarity with the HES proteins and include HRT1, HRT2 and     |  |  |
| HRT3. The HRT family (also designated Hesr, Hey, CHF and Gridlock) contain a bHLH domain,        |  |  |
| an Orange domain and a novel YRPW domain, which is absent in HRT3. The Hairy-related             |  |  |
| genes map to human chromosomes 8q21, 6q21 and 1p34.3 for HRT1, HRT2 and HRT3,                    |  |  |
| respectively, and are downstream targets for Notch signaling. HRT1 is expressed in the somitic   |  |  |
| mesoderm, central nervous system, kidney, heart, nasal epithelium and limb buds in murine        |  |  |
| embryos as well as in adult tissues. It has altered expression in many breast, lung and kidney   |  |  |
| tumors. Like HRT1, HRT2 and HRT3 are also expressed in developing somites, heart and             |  |  |
| nervous system.  |  |  |
