Background: The LIN-12/Notch family of transmembrane receptors plays a central role in			
development by regulating cell fate and establishing boundaries of gene expression. Notch			
signaling activates the Hairy/Enhancer of split (HES) genes, which encode basic helix-loop-helix			
(bHLH) transcriptional repressors that are critical for directing embryonic patterning and			
development. The Hairy-related transcription factors (HRTs) comprise a subclass of bHLH			
proteins that exhibit structural similarity with the HES proteins and include HRT1, HRT2 and			
HRT3. The HRT family (also designated Hesr, Hey, CHF and Gridlock) contain a bHLH domain,			
an Orange domain and a novel YRPW domain, which is absent in HRT3. The Hairy-related			
genes map to human chromosomes 8q21, 6q21 and 1p34.3 for HRT1, HRT2 and HRT3,			
respectively, and are downstream targets for Notch signaling. HRT1 is expressed in the somitic			
mesoderm, central nervous system, kidney, heart, nasal epithelium and limb buds in murine			
embryos as well as in adult tissues. It has altered expression in many breast, lung and kidney			
tumors. Like HRT1, HRT2 and HRT3 are also expressed in developing somites, heart and			
nervous system.
