| | expressed proteins with diverse functions, including the assembly and sequestering of |
|---------------------|--|
| | multiprotein complexes, transportation of nascent polypeptide chains across cellular |
| | membranes and regulation of protein folding. Heat shock proteins (also known as molecular |
| | chaperones) fall into six general families: HSP 90, HSP 70, HSP 60, the small HSPs, the |
| | immunophilins and the HSP 110 family. HSPB7 (heat shock 27 kDa protein family, member 7), |
| | also known as cvHSP (cardiovascular heat shock protein) or Heat shock protein beta-7, is a |
| | member of the small HSP (sHSP) family expressed in heart and skeletal muscle. Members of |
| | the sHSP family contain a conserved C-terminal ?crystallin domain and typically function in |
| | homo- or heteromeric complexes. The sHSPs bind to denatured proteins and are responsible |
| | for preventing the aggregation of these proteins. In response to muscle fiber transformation |
| | and in muscular dystrophy, the expression levels of HSPB7 are drastically increased, |
| | suggesting that HSPB7 may be a useful target in therapeutic strategies for preventing age- |
| | related muscle wasting. |
