|                     | Background: KIF13B is also known as Kinesin-like protein GAKIN or GAKIN and is a 1,826 amino      |
|                     | acid protein that is widely expressed in tissues, with highest expression in brain and kidney.    |
|                     | KIF13B is localized to the cytoplasm, as well as to the cytoskeleton, and is thought to be a      |
|                     | microtubule-dependent motor protein which is able to bind to a variety of proteins in order to    |
|                     | traffic them to various locations throughout the cell. KIF13B belongs to the kinesin-like protein |
|                     | family and possesses three domains typical of the kinesin-like protein family, namely an N-       |
|                     | terminal motor domain with an ATP-binding motif, an FHA domain which is known to bind             |
|                     | diverse cargos and a large stalk domain involved in protein-protein binding. Additionally, KIF13B |
|                     | has a microtubule-interacting sequence which is known as the CAP-Gly domain at its C-             |
|                     | terminus. The CAP-Gly domain is highly conserved domain among eukaryotes, and in humans,          |
|                     | defects in the CAP-Gly domain are implicated in many diseases affecting the trafficking of        |
|                     | vesicles, neuromuscular junctions and lysosome proliferation.                                     |
