Background:	Synonyms: RDL, RNA polymerase-associated protein LEO1, Replicative senescence down-
Daekground.	regulated leo1-like protein, LEO1
	Background: Component of the PAF1 complex (PAF1C) which has multiple functions during
	transcription by RNA polymerase II and is implicated in regulation of development and
	maintenance of embryonic stem cell pluripotency. PAF1C associates with RNA polymerase II
	through interaction with POLR2A CTD non-phosphorylated and 'Ser-2'- and 'Ser-5'-
	phosphorylated forms and is involved in transcriptional elongation, acting both indepentently
	and synergistically with TCEA1 and in cooperation with the DSIF complex and HTATSF1.
	PAF1C is required for transcription of Hox and Wnt target genes. PAF1C is involved in
	hematopoiesis and stimulates transcriptional activity of KMT2A/MLL1, it promotes
	leukemogenesis through association with KMT2A/MLL1-rearranged oncoproteins, such as
	KMT2A/MLL1-MLLT3/AF9 and KMT2A/MLL1-MLLT1/ENL. PAF1C is involved in histone
	modifications such as ubiquitination of histone H2B and methylation on histone H3 'Lys-4'
	(H3K4me3). PAF1C recruits the RNF20/40 E3 ubiquitin-protein ligase complex and the E2
	enzyme UBE2A or UBE2B to chromatin which mediate monoubiquitination of 'Lys-120' of
	histone H2B (H2BK120ub1), UB2A/B-mediated H2B ubiquitination is proposed to be coupled to
	transcription. PAF1C is involved in mRNA 3' end formation probably through association with
	cleavage and poly(A) factors. In case of infection by influenza A strain H3N2, PAF1C associate
	with viral NS1 protein, thereby regulating gene transcription. Involved in polyadenylation of
	mRNA precursors. Connects PAF1C to Wnt signaling.
