Background:	Synonyms: Superficial zone proteoglycan, articular superficial zone protein, bG174L6.2, CACP,	
	camptodactyly arthropathy coxa vara pericarditis syndrome gene, FLJ32635, HAPO, Jacobs

	factor, MSF, PRG 4, PRG4, proteoglycan 4, Proteoglycan4, Superficial zone proteoglycan, SZP.	
	Background: Lubricin, also designated proteoglycan-4 or megakaryocyte stimulating factor, is	
	important for boundary lubrication within articulating joints. It is a disulfide-linked homodimer	
	(between Cysteine 1146 and Cysteine 1403) that is essential for protein cleavage. Lubricin	
	inhibits synovial cell adhesion to the cartilage surface, but also prevents the deposition of	
	proteins from synovial fluid onto cartilage. Lubricin is highly expressed in cartilage, liver and	
	synovial tissue. Defects in the gene encoding for lubricin can cause Jakobs syndrome, also	
	designated camptodactyly-arthropathy-coxa vara-pericarditis syndrome (CACP). CACP is an	
	autosomal recessive disorder characterized by joint failure associated with noninflammatory	
	synoviocyte hyperplasia and subinitimal fibrosis of the synovial capsule. Lubricin undergoes	
	different levels of glycosylation and may be detected at varying molecular weights.
