Background: MHC Class I molecules play a central role in the immune system by presenting
peptides derived from the endoplasmic reticulum lumen. MHC class I antigens are
heterodimers consisting of one alpha chain (44 kDa) with beta 2 microglobulin (11.5 kDa). The
antigen is expressed by all somatic cells at varying levels. MHC Class I molecules are
expressed on most nucleated cells where they present endogenously synthesized antigenic
peptides to CD8+ T lymphocytes, which are usually cytotoxic T cells. Fibroblasts or neurons
however only show a low level of antigen.
