| | Background: The protein encoded by this gene is a member of the S100 family of proteins |
| | containing 2 EF-hand calcium-binding motifs. S100 proteins are localized in the cytoplasm |
| | and/or nucleus of a wide range of cells, and involved in the regulation of a number of cellular |
| | processes such as cell cycle progression and differentiation. S100 genes include at least 13 |
| | members which are located as a cluster on chromosome 1q21. This protein may function in |
| | the inhibition of casein kinase and as a cytokine. Altered expression of this protein is associated |
| | with the disease cystic fibrosis. [provided by RefSeq]. |
