|---|
| Background: Netrin proteins are a family of laminin-related secreted proteins that provide |
| guidance signals for axonal growth and cell migration during development. Netrin signaling is |
| dependent on the concentration of calcium outside the cell and the level of PKA activity. In |
| axonal cells, a reduction in PKA activity converts the responsiveness of the axons to the netrin |
| proteins, as the cells are repelled, rather than attracted, by the netrin gradient. Netrin-4 is related |
| to the Laminin chains, and is therefore also designated -netrin. It is present in the basement |
| membranes of the vasculature, lateral olfactory tract, kidney and ovary. In humans, the gene |
| encoding for the netrin-4 protein is localized to chromosome 12q22-q23. High levels of netrin-4 |
| mRNA have also been detected in many cells and tissues, including cerebral cortex, |
| hippocampus, amygdaloid nuclei and Purkinje cells. Netrin-4 is important in neural, kidney and |
| vascular development. |
