Background:	Synonyms: Neurexin 2, Neurexin-2, Neurexin2, Neurexin II, Neurexin II alpha, NRXN 2, NRXN-2, NRXN2, NRXN2, NRXN2, NRX2A_HUMAN.
	Background: Neurexins comprise a family of neuronal cell surface proteins, which include
	neurexin I (NRXN1), neurexin II (NRXN2), neurexin III (NRXN3) and Caspr (neurexin IV).
	Neurexins I-III are expressed as a and b isoforms. The a isoforms are made of three cassettes,
	which contain two LNS (Laminin A, Neurexins, Sex hormone-binding)-domains separated by
	EGF domains, followed by a transmembrane region and a 55 amino acid cytoplasmic C-
	terminal. The a isoforms bind to neurexophilins at the second LNS site and to the excitatory
	neurotoxin a-latrotoxin. The b isoforms have only one LNS-domain, bind to neuroligins, and play
	a role in the formation and remodeling of synapes. Caspr (for Contactin-Associated Protein 1,
	also designated Paranodin in mouse), contains an extracellular domain similar to the other
	three neurexins, and binds to the surface glycoprotein Contactin. Caspr and the closely related
	Caspr2, a mammalian homolog of Drosophila Neurexin IV (Nrx-IV), demarcate distinct
	subdomains in myelinated axons. Specifically, Caspr exists at the paranodal junctions, while
	Caspr2 colocalizes with Shaker-like K+ channels in the juxtaparanodal region. Caspr may play a
	role in the communication of glial cells and neurons during development.
