	Background: Neuropeptides are regulators of synaptic transmission and their effects are
	mediated by G-protein coupled receptors. NPS (Neuropeptide S) is a 20 amino acid peptide
	cleaved from a larger precursor that contains a hydrophobic signal peptide and proteolytic
	cleavage processing sites. The N-terminal residue of NPS is always a serine regardless of the
	species. NPS is predominantly found in the central nervous system and plays an important role
	regulating sleep/wake functions, locomotion, arousal/anxiety responses and food intake. NPS
	functions by binding and activating its receptor, NPSR, and increasing intracellular calcium
	levels thereby acting as an excitatory transmitter. In addition, NPS stimulates the hypothalamo-
	pituitary adrenal (HPA) axis via the release of corticotropin-releasing factor (CRF) and arginine
	vasopressin (AVP). NPS and its receptor NPSR may also play a role in asthma pathogenesis.
