	Background: G protein-coupled receptors (GPRs), also known as seven transmembrane	
	receptors, heptahelical receptors or 7TM receptors, comprise a superfamily of proteins that	
	play a role in many different stimulus-response pathways. G protein coupled receptors translate	
	extracellular signals into intracellular signals (G protein activation) and they respond to a variety	
	of signaling molecules, such as hormones and neurotransmitters. GPR154 (G-protein coupled	
	receptor 154), also known as NPSR1 (neuropeptide S receptor), GPRA (G-protein coupled	
	receptor for asthma susceptibility) or PGR14, is a 371 amino acid protein that is thought to play	
	a role in autocrine or paracrine signaling pathways. Ubiquitously expressed, GPR154 exists as	
	nine alternatively spliced isoforms. Defects in the gene encoding GPR154 is the cause of	
	asthma-related traits type 2 (ASRT2).
