| | Background: Photoreceptor-specific nuclear receptor, also known as NR2E3 or PNR, belongs to |
| | a large family of nuclear hormone receptor transcription factors. The proteins belonging to this |
| | family are characterized by discrete domains functioning in DNA and ligand binding. NR2E3 has |
| | a role in regulating the signaling pathway elemental to the photoreceptor cell function and in |
| | regulating pathways involved in embryonic development. NR2E3 is an eye specific nuclear |
| | protein found in the outer nuclear layer of the adult retina (where the nuclei of cone and rod |
| | photoreceptors are located). Defects in this gene encoding for the protein, which localizes to |
| | chromosome 15q22.32, cause enhanced S cone syndrome. |
| Pathways: | Nuclear Receptor Transcription Pathway, Steroid Hormone Mediated Signaling Pathway |
