E	Background: Cadherins are calcium-dependent cell-cell adhesion molecules, and
þ	protocadherins constitute a subfamily of nonclassic cadherins. Protocadherin beta 13 is a
r	nember of the protocadherin beta gene cluster, one of three related gene clusters tandemly
li	inked on chromosome five. The gene clusters demonstrate an unusual genomic organization
S	similar to that of B-cell and T-cell receptor gene clusters. The beta cluster contains 16 genes
e	and 3 pseudogenes, each encoding 6 extracellular cadherin domains and a cytoplasmic tail that
C	deviates from others in the cadherin superfamily. The extracellular domains interact in a
ł	nomophilic manner to specify differential cell-cell connections. Unlike the alpha and gamma
C	clusters, the transcripts from these genes are made up of only one large exon, not sharing
C	common 3' exons as expected. These neural cadherin-like cell adhesion proteins are integral
p	plasma membrane proteins. Their specific functions are unknown but they most likely play a
C	critical role in the establishment and function of specific cell-cell neural connections.
