	Background: Phemx is a member of the tetraspanin (TM4SF) family of proteins that may be	
	involved in transmembrane signal transduction, regulation of cell proliferation, differentiation	
	and motility. Phemx is a multi-pass membrane protein containing intracellular N- and C-terminal	
	domains, four transmembrane domains and two extracellular loops. It is ubiquitously	
	expressed from early embryogenesis through adulthood. Phemx exhibits predominant	
	expression in hematopoietic tissues suggesting a role in hematopoietic-cell function. In	
	association with the Integrin IIb/Integrin _3 complex, Phemx functions to stabilize arterial	
	thrombi in platelets and regulate outside-in? signaling. This interaction may be important in the	
	process of wound healing. The gene encoding Phemx is located in an important tumor-	
	suppressor gene region that has been associated with Beckwith-Wiedemann syndrome as well	
	as a variety of cancers.
