| | Background: PSD 93 is believed to participate in the clustering of certain proteins, including N- | |
| | methyl-D-aspartate (NMDA) receptors and shaker-type potassium channels at the synaptic | |
| | membrane. There are two principal modes of interaction between PSD 93 and other proteins. | |
| | NMDA receptors and shaker-type potassium channels both share C-terminal sequence | |
| | homology consisting of a threonine/serine-X-valine-COOH (T/SXV) motif. Other neuronal | |
| | proteins that share this motif (beta 1 adrenergic receptor, some serotonin receptors, some | |
| | sodium channel subunits, and additional potassium channel subunits) may interact with PSD | |
| | 93 by binding to its PDZ domains. Neuronal nitric oxide synthase (nNOS), which lacks the | |
| | T/SXV motif but which has its own PDZ domain, has been shown to associate with PSD 93 in | |
| | vitro through a pseudo-homotypic PDZ-PDZ interaction. | |
