Background: The protein encoded by this gene is a member of the protein tyrosine phosphatase
(PTP) family. PTPs are known to be signaling molecules that regulate a variety of cellular
processes including cell growth, differentiation, mitotic cycle, and oncogenic transformation.
This gene is preferentially expressed in a variety of hematopoietic cells, and is an early
response gene in lymphokine stimulated cells. The non-catalytic N-terminus of this PTP can
interact with MAP kinases and suppress the MAP kinase activities. This PTP was shown to be
involved in the regulation of T cell antigen receptor (TCR) signaling, which was thought to
function through dephosphorylating the molecules related to MAP kinase pathway. Multiple
alternatively spliced transcript variants have been found for this gene. [provided by RefSeq].
