Target Details	
Background:	Synonyms: GLSS, DNA-binding protein SATB2, Special AT-rich sequence-binding protein 2, SATB2, KIAA1034
	Background: Binds to DNA, at nuclear matrix- or scaffold-associated regions. Thought to
	recognize the sugar-phosphate structure of double-stranded DNA. Transcription factor
	controlling nuclear gene expression, by binding to matrix attachment regions (MARs) of DNA
	and inducing a local chromatin-loop remodeling. Acts as a docking site for several chromatin
	remodeling enzymes and also by recruiting corepressors (HDACs) or coactivators (HATs)
	directly to promoters and enhancers. Required for the initiation of the upper-layer neurons (UL1
	specific genetic program and for the inactivation of deep-layer neurons (DL) and UL2 specific
	genes, probably by modulating BCL11B expression. Repressor of Ctip2 and regulatory
	determinant of corticocortical connections in the developing cerebral cortex. May play an
	important role in palate formation. Acts as a molecular node in a transcriptional network
	regulating skeletal development and osteoblast differentiation.
