Background:	Synonyms: Putative voltage gated sodium channel subunit alpha Nax, SCN 6A, SCN 7A, SCN6A,
	Sodium channel protein cardiac and skeletal muscle subunit alpha, Sodium channel protein
	type 7 subunit alpha, Sodium channel protein type VII subunit alpha, Sodium channel voltage
	gated type VI alpha polypeptide, Sodium channel voltage gated type VII alpha, Sodium channel
	voltage gated type VII alpha polypeptide, Voltage dependent sodium channel alpha subunit,
	SCN7A_HUMAN.
	Background: Voltage-gated sodium channels are selective ion channels that regulate the
	permeability of sodium ions in excitable cells. During the propagation of an action potential,
	sodium channels allow an influx of sodium ions, which rapidly depolarize the cell. The three
	glycoproteins that comprise the voltage-gated sodium channel proteins include a pore-forming
	Beta subunit, a noncovalently associated Beta 1 subunit and a disulfide-linked Beta 2 subunit.
	Na+ CP type VII Alpha (Sodium channel protein type 7 subunit alpha), also known as SCN6A,
	Sodium channel protein cardiac and skeletal muscle subunit alpha and putative voltage-gated
	sodium channel subunit alpha Nax, is a 1682 amino acid multi-pass membrane protein that
	belongs to the sodium channel family. Primarily expressed in uterus and heart, Na+ CP type VII
	Alpha may function in the regulation of salt intake behavior and central sensing of body-fluid
	sodium levels.
