Background: SCUBE3 is a novel secreted 993 amino acid cell-surface osteoblast protein that
plays an important role in bone cell biology. While highly expressed in osteoblasts, SCUBE3
expression is unobservable or very low in non-bone tissues. SCUBE3 forms homo-oligomers
and hetero-oligomers with SCUBE1, and may undergo C-terminal proteolytic cleavage or
become N-glycosylated following translation. Two SCUBE3 isoforms exist as a result of
alternative splicing events. SCUBE3 contains one CUB domain and nine EGF-like domains, and
is encoded by a gene which maps to human chromosome 6p21.31, a region associated with a
rare form of metabolic bone disease known as Paget's disease. Chromosome 6 contains 170
million base pairs and comprises nearly 6 % of the human genome.
