Background:	Synonyms: Septin-14, SEPT14		
	Background: Septin 14, also known as SEPT14, is a 432 amino acid protein that belongs to the		
	septin family. The highly conserved septin family of GTP-binding cytoskeletal proteins is		
	implicated in membrane transport, apoptosis, cell polarity, cell cycle regulation, cytokinesis and		
	other cellular functions. Septins polymerize into heterooligomeric protein complexes that form		
	filaments, and can associate with cellular membranes, actin filaments and microtubules. Septin		
	14 has a GTPase domain followed by a C-terminal coiled-coil domain characteristic of group II		
	septins. Septin 14 interacted with all septins except those that are members of its phylogenetic		
	cluster, including itself. Septin 14 shares highest identity (67 %) with Septin 10. Expressed in		
	testis and more weakly in fetal liver, tonsil and thymus, the Septin 14 protein is not detected in		
	testicular cancer or other normal or cancer cell lines. The Septin 14 gene is conserved in		
	chimpanzee, dog, cow, mouse and rat, and maps to human chromosome 7p11.2.
