| Background: | Synonyms: SEB, MRD29, SET-binding protein, SETBP1, KIAA0437 |
|-------------|--|
| | Background: SETBP1 (SET binding protein 1), also known as SEB, is a 1,542 amino acid nuclear |
| | protein that contains three AT hook DNA-binding domains, one SKI homology region and a C- |
| | terminal SET-binding domain, which is followed by three PPLPPPPP repeats. SETBP1 may be |
| | involved in SET-related tumorigenesis and leukemogenesis by regulating the transforming |
| | activity of SKI in the nucleus or suppressing SET function. As a widely expressed protein, |
| | SETBP1 is encoded by a gene that maps to human chromosome 18, which houses over 300 |
| | protein-coding genes and contains nearly 76 million bases. There are a variety of diseases |
| | associated with defects in chromosome 18-localized genes, some of which include Trisomy 18 |
| | (also known as Edwards syndrome), Niemann-Pick disease, hereditary hemorrhagic |
| | telangiectasia, erythropoietic protoporphyria and follicular lymphomas. |
| Gene ID: | 26040 |
| UniProt: | Q9Y6X0 |
