| Background:         | Synonyms: Stimulated by retinoic acid gene 6 protein homolog, STRA6_HUMAN.                      |  |
|                     | Background: STRA6 is a 667 amino acid, multi-pass cell membrane protein. Stra6 functions as     |  |
|                     | a cell-surface receptor for the complex retinol-retinol binding protein (RBP/RBP4). Ultimately  |  |
|                     | increasing cellular retinol uptake from the retinol-RBP complex, Stra6 removes retinol from     |  |
|                     | RBP/RPB4 and transports it across the plasma membrane, where it is metabolized. Stra6 is        |  |
|                     | broadly expressed, with 4 named isoforms that exist as a result of alternative splicing events. |  |
|                     | Mutations in the gene encoding Stra6 cause Matthew-Wood Syndrome, also known as Spear           |  |
|                     | Syndrome. This syndrome is characterized by anophtalmia, mild facial dysmorphism and            |  |
|                     | malformations of the heart, lung and diaphragm. The Stra6 gene maps to chromosome               |  |
