	KIAA1561
	Background: Regulates APAF1 expression and plays an important role in the regulation of
	stress-induced apoptosis. Promotes apoptosis by regulating three pathways, apoptosome up-
	regulation, LGALS3/galectin-3 down-regulation and NF-kappa-B inactivation. Regulates the
	redistribution of APAF1 into the nucleus after proapoptotic stress. Down-regulates the
	expression of LGALS3 by inhibiting NFKB1 (By similarity). Modulates isoactin dynamics to
	regulate the morphological alterations required for cell growth and motility. Interaction with
	ARF6 may modulate cell shape and motility after injury (By similarity).
