	Background: UBE2H, also known as UBC8, UBCH, UBCH2 or E2-20K, is a 183 amino acid
	protein involved in ubiquitin-mediated protein degradation. Ubiquitination is an important
	mechanism through which three classes of enzymes act in concert to target short-lived or
	abnormal proteins for destruction. The three classes of enzymes involved in ubiquitination are
	the ubiquitin-activating enzymes (E1s), the ubiquitin-conjugating enzymes (E2s) and the
	ubiquitin-protein ligases (E3s). One of several members of the ubiquitin-conjugating enzyme
	family, UBE2H functions as an E2 ubiquitin-conjugating enzyme that acts to catalyze the
	covalent attachment of ubiquitin residues to various proteins, including Histone H2A. UBE2H
	shares 100 % identity with its mouse counterpart and 98 % identity with its frog and zebrafish
	homologs, suggesting a conserved function between species. Multiple isoforms of UBE2H exist
	due to alternative splicing events.
