	1 confers tissue specificity depends largely on the interaction of TEF-1 with tissue-specific
	cofactors. Transcription cofactor VgI-3 (vestigial-like protein 3), also known as colon carcinoma
	related protein, is a 326 amino acid nuclear protein that may act as a specific coactivator for
	the mammalian transcription elongation factors. Both Vgl-1 and Vgl-3 are enriched in placenta,
	whereas Vgl-2 is expressed in differentiating somites and branchial arches during
	embryogenesis and is skeletal-muscle specific in adult tissues. There are two isoforms of Vgl-3
	that are produced as a result of alternative splicing events.
