Target Details		
Target Type:	Dipeptide	
Background:	ROS such as hydrogen peroxide (H2O2), superoxide, and hydroxyl radicals can react with both	
	the backbone and the side chains of proteins, leading to backbone cleavage and side-chain	
	modifications, respectively. Peroxidases, UV radiation, and hydroxyl radicals catalyze the	
	formation of tyrosyl radicals which then react to form cross-links between proteins (1). This	
	produces dityrosine, a metabolically stable biomarker of protein oxidation (2).	

Application Details

Application Notes:	 WB (1:1000) ICC/IF (1:50) FACS (1:50) FCM (1:50) ELISA (1:1000) optimal dilutions for assays should be determined by the user.
Comment:	A 1:1000 dilution of ABIN5067482 was sufficient for detection of dityrosine in 1 μ g of Dityrosine conjugated to BSA by ECL immunoblot analysis using Goat Anti-Mouse IgG:HRP as the secondary Antibody.
Restrictions:	For Research Use only
