## Target Details

Background:	Background: Endostatin is a naturally-occurring 20- kDa C-terminal fragment derived from type
	XVIII collagen. It is reported to serve as an anti-angiogenic agent, similar to angiostatin and
	thrombospondin. And It is produced by proteolytic cleavage of collagen XVIII, a member of the
	multiplexin family that is characterized by interruptions in the triple helix creating multiple
	domains, by proteases such as cathepsins. Using a genomic clone as a probe for fluorescence
	in situ hybridization, Endostatin was mapped the COL18A1 gene to 21q22.3. By
	immunoprecipitation analysis using membrane fractions of human mammary epithelial cells, It
	showed that endostatin specifically bound to cell surface nucleolin with high affinity. Blockage
	of nucleolin with neutralizing antibody or knockdown of nucleolin by RNA interference
	countered the antiendothelial activity of endostatin and abrogated its antiangiogenic and
	antitumor activity in vivo.
