	molecules that can induce ectopic bone growth. Many BMPs are part of the transforming
	growth factor-beta (TGFB) superfamily. BMPs were originally identified by an ability of
	demineralized bone extract to induce endochondral osteogenesis in vivo in an extraskeletal site.
	Based on its expression early in embryogenesis, BMP-6 has a proposed role in early
	development. In addition, the fact that this BMP is closely related to BMP5 and BMP7 has lead
	to speculation of possible bone inductive activity.
