### **Target Details**

serine proteinase with trypsin-like specificity. It is stored in the acrosome in its precursor form,		
proacrosin. The active enzyme functions in the lysis of the zona pellucida, thus facilitating		
penetration of the sperm through the innermost glycoprotein layers of the ovum. The mRNA for		
proacrosin is synthesized only in the postmeiotic stages of spermatogenesis. In humans		
proacrosin first appears in the haploid spermatids.		

Molecular Weight:	46 kDa
Gene ID:	49
UniProt:	P10323
