	antagonists, and plasticizers, this term arises because they induce an increase in the size and
	number of peroxisomes. Peroxisomes are subcellular organelles found in plants and animals
	that contain enzymes for respiration and for cholesterol and lipid metabolism. The action of
	peroxisome proliferators is thought to be mediated via specific receptors, called PPARs, which
	belong to the steroid hormone receptor superfamily. PPARs affect the expression of target
	genes involved in cell proliferation, cell differentiation and in immune and inflammation
	responses. Three closely related subtypes (alpha, beta/delta, and gamma) have been identified.
	This gene encodes the subtype PPAR-alpha, which is a nuclear transcription factor. Multiple
	alternatively spliced transcript variants have been described for this gene, although the full-
	length nature of only two has been determined. ,
	Aliases: PPAR, NR1C1, hPPAR, PPARalpha
