	cell response to interferon stimulation. Two transcript variants encoding different isoforms
	well as JAK2 and TYK2 kinases, which implicated the role of this PTP in cell growth control, and
	This PTP was also reported to dephosphorylate epidermal growth factor receptor kinase, as
	insulin signaling by dephosphorylating the phosphotryosine residues of insulin receptor kinase.
	and oncogenic transformation. This PTP has been shown to act as a negative regulator of
	that regulate a variety of cellular processes including cell growth, differentiation, mitotic cycle,
	motif, which is essential for the catalytic activity. PTPs are known to be signaling molecules
	specifically on tyrosine residues. Members of the PTP family share a highly conserved catalytic
	and amino acid sequence. PTPs catalyze the hydrolysis of the phosphate monoesters
