

Datasheet for ABIN5652568 **CPA1 ELISA Kit**

Overview

Quantity:	96 tests
Target:	CPA1
Reactivity:	Rat
Method Type:	Sandwich ELISA
Detection Range:	1.56 ng/mL - 100 ng/mL
Minimum Detection Limit:	1.56 ng/mL
Application:	ELISA

Product Details

Sample Type:	Plasma, Serum	
Analytical Method:	Quantitative	
Detection Method:	Colorimetric	
Specificity:	This assay has high sensitivity and excellent specificity for detection of Carboxypeptidase A1, Pancreatic (CPA1). No significant cross-reactivity or interference between Carboxypeptidase A1, Pancreatic (CPA1) and analogues was observed.	
Sensitivity:	0.53 ng/mL	
Target Details		
Target:	CPA1	
Alternative Name:	Carboxypeptidase A1, Pancreatic (CPA1 Products)

Target Details	
Background:	Gene Name: Carboxypeptidase A1, Pancreatic
Gene ID:	24269
UniProt:	P00731

Application Details

Comment:	The stability of kit is determined by the loss rate of activity. The loss rate of this kit is less than	
	5 % within the expiration date under appropriate storage condition. To minimize extra influence	
	on the performance, operation procedures and lab conditions, especially room temperature, air	
	humidity, incubator temperature should be strictly controlled. It is also strongly suggested that	
	the whole assay is performed by the same operator from the beginning to the end.	
Assay Time:	3 h	
Plate:	Pre-coated	
Protocol:	The test principle applied in this kit is Sandwich enzyme immunoassay. The microtiter plate	
	provided in this kit has been pre-coated with an antibody specific to Carboxypeptidase A1,	
	Pancreatic (CPA1). Standards or samples are then added to the appropriate microtiter plate	
	wells with a biotin-conjugated antibody specific to Carboxypeptidase A1, Pancreatic (CPA1).	
	Next, Avidin conjugated to Horseradish Peroxidase (HRP) is added to each microplate well and	
	incubated. After TMB substrate solution is added, only those wells that contain	
	Carboxypeptidase A1, Pancreatic (CPA1), biotin-conjugated antibody and enzyme-conjugated	
	Avidin will exhibit a change in color. The enzyme-substrate reaction is terminated by the	
	addition of sulphuric acid solution and the color change is measured spectrophotometrically at	
	a wavelength of 450nm \pm 10nm. The concentration of Carboxypeptidase A1, Pancreatic (CPA1)	
	in the samples is then determined by comparing the O.D. of the samples to the standard curve.	
Assay Precision:	Intra-assay Precision (Precision within an assay): 3 samples with low, middle and high level	
	Carboxypeptidase A1, Pancreatic (CPA1) were tested 20 times on one plate, respectively	
	Inter-assay Precision (Precision between assays): 3 samples with low, middle and high level	
	Carboxypeptidase A1, Pancreatic (CPA1) were tested on 3 different plates, 8 replicates in each	
	plate. CV(%) = SD/meanX100	
	Intra-Assay: CV<10%	
	Inter-Assay: CV<12%	
Restrictions:	For Research Use only

Handling Advice:	The Stop Solution is acidic. Do not allow to contact skin or eyes. Calibrators, controls and specimen samples should be assayed in duplicate. Once the procedure has been started, all steps should be completed without interruption.
Storage:	4 °C,-20 °C
Storage Comment:	-20°C. Bring all reagents to room temperature before beginning test. The kit may be stored at 4°C for immediate use within two days upon arrival. Reseal any unused strips with desiccant pack. Minimize freeze/thaw cycles.
Expiry Date:	4-8 months
