

Datasheet for ABIN5656816 MIA ELISA Kit

Overview

Quantity:	96 tests
Target:	MIA
Reactivity:	Mouse
Method Type:	Sandwich ELISA
Detection Range:	78.12 pg/mL - 5000 pg/mL
Minimum Detection Limit:	78.12 pg/mL
Application:	ELISA

Product Details

Sample Type:	Plasma, Serum, Tissue Homogenate
Analytical Method:	Quantitative
Detection Method:	Colorimetric
Specificity:	This assay has high sensitivity and excellent specificity for detection of Melanoma Inhibitory Activity Protein 1 (MIA1). No significant cross-reactivity or interference between Melanoma Inhibitory Activity Protein 1 (MIA1) and analogues was observed.
Sensitivity:	37 pg/mL
Target Details	
Target:	MIA
Alternative Name:	Melanoma Inhibitory Activity Protein 1 (MIA Products)

Target Details		
Background:	Gene Name: Melanoma Inhibitory Activity Protein 1	
	Gene Aliases: CD-RAP, Melanoma-derived growth regulatory protein	
Gene ID:	12587	
UniProt:	Q61865	
Application Details		
Comment:	The stability of kit is determined by the loss rate of activity. The loss rate of this kit is less than	
	5% within the expiration date under appropriate storage condition. To minimize extra influence	
	on the performance, operation procedures and lab conditions, especially room temperature, air	
	humidity, incubator temperature should be strictly controlled. It is also strongly suggested that	
	the whole assay is performed by the same operator from the beginning to the end.	
Assay Time:	3 h	
Plate:	Pre-coated	
Protocol:	The test principle applied in this kit is Sandwich enzyme immunoassay. The microtiter plate	
	provided in this kit has been pre-coated with an antibody specific to Melanoma Inhibitory	
	Activity Protein 1 (MIA1). Standards or samples are then added to the appropriate microtiter	
	plate wells with a biotin-conjugated antibody specific to Melanoma Inhibitory Activity Protein 1	
	(MIA1). Next, Avidin conjugated to Horseradish Peroxidase (HRP) is added to each microplate	
	well and incubated. After TMB substrate solution is added, only those wells that contain	
	Melanoma Inhibitory Activity Protein 1 (MIA1), biotin-conjugated antibody and enzyme-	
	conjugated Avidin will exhibit a change in color. The enzyme-substrate reaction is terminated by	
	the addition of sulphuric acid solution and the color change is measured	
	spectrophotometrically at a wavelength of 450nm \pm 10nm. The concentration of Melanoma	
	Inhibitory Activity Protein 1 (MIA1) in the samples is then determined by comparing the O.D. of	
	the samples to the standard curve.	
Assay Precision:	Intra-assay Precision (Precision within an assay): 3 samples with low, middle and high level	
	Melanoma Inhibitory Activity Protein 1 (MIA1) were tested 20 times on one plate, respectively	
	Inter-assay Precision (Precision between assays): 3 samples with low, middle and high level	
	Melanoma Inhibitory Activity Protein 1 (MIA1) were tested on 3 different plates, 8 replicates in	
	each plate. CV(%) = SD/meanX100	
	Intra-Assay: CV<10%	
	Inter-Assay: CV<12%	
Restrictions:	For Research Use only

Handling Advice:	The Stop Solution is acidic. Do not allow to contact skin or eyes. Calibrators, controls and specimen samples should be assayed in duplicate. Once the procedure has been started, all steps should be completed without interruption.
Storage:	4 °C,-20 °C
Storage Comment:	-20°C. Bring all reagents to room temperature before beginning test. The kit may be stored at 4°C for immediate use within two days upon arrival. Reseal any unused strips with desiccant pack. Minimize freeze/thaw cycles.
Expiry Date:	4-8 months
