Target Details

Background:	<p>Synonyms: Uridine 5'-monophosphate synthase, UMPS, UMP synthase, Orotate phosphoribosyltransferase, OPRT, OPRTase, ODC, OMPdecase, OK/SW-cl.21</p> <p>Background: This gene encodes a uridine 5'-monophosphate synthase. The encoded protein is a bifunctional enzyme that catalyzes the final two steps of the de novo pyrimidine biosynthetic pathway. The first reaction is carried out by the N-terminal enzyme orotate phosphoribosyltransferase which converts orotic acid to orotidine-5'-monophosphate. The terminal reaction is carried out by the C-terminal enzyme OMP decarboxylase which converts orotidine-5'-monophosphate to uridine monophosphate. Defects in this gene are the cause of hereditary orotic aciduria. Alternate splicing results in multiple transcript variants.</p>
