	catalyze the oxidative decarboxylation of isocitrate to produce alfa ketoglutarate. The human
	genome has 5 IDH genes coding for 3 IDH enzymes. The IDH1 and IDH2 require nicotinamide
	adeninedinucleotide phosphate (NADP) as co-substrate, whereas IDH3 require nicotinamide
	adenine dinucleotide (NAD). The IDH2 and 3 are localized in mitochondria and are actively
	involved in the citric acid cycle (TCA) for energy production in contrast, IDH1 is localized in
	cytoplasm and peroxisomes where it generates NADPH, reduced form of NADP for biosynthetic
	and other types of reaction. Since alfa KG and NADPH both are intermediately substrate for a
	number of cellular process, which allows the possibility of oncogenic or tumor suppressive
	activities of IDH1.Synonyms: Cytosolic NADP-isocitrate dehydrogenase, ICDH, IDP, NADP(+)-
	specific ICDH, Oxalosuccinate decarboxylase, PICD, cytoplasmic Isocitrate dehydrogenase
