Target Details

Target:	KCNJ1
Alternative Name:	KCNJ1 (KCNJ1 Products)
Background:	In the kidney, probably plays a major role in potassium homeostasis. Inward rectifier potassium

Target Details

channels are characterized by a greater tendency to allow potassium to flow into the cell rather than out of it. Their voltage dependence is regulated by the concentration of extracellular potassium, as external potassium is raised, the voltage range of the channel opening shifts to more positive voltages. The inward rectification is mainly due to the blockage of outward current by internal magnesium. This channel is activated by internal ATP and can be blocked by external barium.
