Background:	Serine/threonine kinase which acts as an essential component of the MAP kinase signal
	transduction pathway. Plays an important role in the cascades of cellular responses evoked by
	changes in the environment. Mediates signal transduction of TRAF6, various cytokines
	including interleukin-1 (IL-1), transforming growth factor-beta (TGFB), TGFB-related factors like
	BMP2 and BMP4, toll-like receptors (TLR), tumor necrosis factor receptor CD40 and B-cell
	receptor (BCR). Ceramides are also able to activate MAP3K7/TAK1. Once activated, acts as an
	upstream activator of the MKK/JNK signal transduction cascade and the p38 MAPK signal
	transduction cascade through the phosphorylation and activation of several MAP kinase
	kinases like MAP2K1/MEK1, MAP2K3/MKK3, MAP2K6/MKK6 and MAP2K7/MKK7. These
	MAP2Ks in turn activate p38 MAPKs, c-jun N-terminal kinases (JNKs) and I-kappa-B kinase
	complex (IKK). Both p38 MAPK and JNK pathways control the transcription factors activator
	protein-1 (AP-1), while nuclear factor-kappa B is activated by IKK. MAP3K7 activates also IKBKB
	and MAPK8/JNK1 in response to TRAF6 signaling and mediates BMP2- induced apoptosis. In
	osmotic stress signaling, plays a major role in the activation of MAPK8/JNK1, but not that of
	NF-kappa-B. Promotes TRIM5 capsid-specific restriction activity.
