Target Details	
Alternative Name:	RARA (RARA Products)
Background:	Description: Receptor for retinoic acid. Retinoic acid receptors bind as heterodimers to their
	target response elements in response to their ligands, all-trans or 9-cis retinoic acid, and
	regulate gene expression in various biological processes. The RXR/RAR heterodimers bind to
	the retinoic acid response elements (RARE) composed of tandem 5'-AGGTCA-3' sites known as
	DR1-DR5. In the absence of ligand, the RXR-RAR heterodimers associate with a multiprotein
	complex containing transcription corepressors that induce histone acetylation, chromatin
	condensation and transcriptional suppression. On ligand binding, the corepressors dissociate
	from the receptors and associate with the coactivators leading to transcriptional activation.
	RARA plays an essential role in the regulation of retinoic acid-induced germ cell development
	during spermatogenesis. Has a role in the survival of early spermatocytes at the beginning
	prophase of meiosis. In Sertoli cells, may promote the survival and development of early
	meiotic prophase spermatocytes. In concert with RARG, required for skeletal growth, matrix
	homeostasis and growth plate function (By similarity).

Immunohistochemistry

Image 2. ABIN6266463 at 1/200 staining human Testis tissue sections by IHC-P. The tissue was formaldehyde fixed and a heat mediated antigen retrieval step in citrate buffer was performed. The tissue was then blocked and incubated with the antibody for 1.5 hours at 22°C. An HRP conjugated goat anti-rabbit antibody was used as the secondary.

Immunofluorescence (fixed cells)

Image 3. ABIN6266463 staining Hela by IF/ICC. The sample were fixed with PFA and permeabilized in 0.1% Triton X-100,then blocked in 10% serum for 45 minutes at 25°C. The primary antibody was diluted at 1/200 and incubated with the sample for 1 hour at 37°C. An Alexa Fluor 594 conjugated goat anti-rabbit IgG (H+L) Ab, diluted at 1/600, was used as the secondary antibody.
