Target Details	
Alternative Name:	SEPT2 (SEPT2 Products)
Background:	Description: Filament-forming cytoskeletal GTPase. Forms a filamentous structure with
	SEPT12, SEPT6, SEPT2 and probably SEPT4 at the sperm annulus which is required for the
	structural integrity and motility of the sperm tail during postmeiotic differentiation
	(PubMed:25588830). Required for normal organization of the actin cytoskeleton. Plays a role in
	the biogenesis of polarized columnar-shaped epithelium by maintaining polyglutamylated
	microtubules, thus facilitating efficient vesicle transport, and by impeding MAP4 binding to
	tubulin. Required for the progression through mitosis. Forms a scaffold at the midplane of the
	mitotic splindle required to maintain CENPE localization at kinetochores and consequently
	chromosome congression. During anaphase, may be required for chromosome segregation
	and spindle elongation. Plays a role in ciliogenesis and collective cell movements. In cilia,
	required for the integrity of the diffusion barrier at the base of the primary cilium that prevents
	diffusion of transmembrane proteins between the cilia and plasma membranes: probably acts
	by regulating the assembly of the tectonic-like complex (also named B9 complex) by localizing
	TMEM231 protein. May play a role in the internalization of 2 intracellular microbial pathogens,
	Listeria monocytogenes and Shigella flexneri.
	Gene: 2-Sep
