Target Details	
Background:	Description: Atypical chemokine receptor that controls chemokine levels and localization via
	high-affinity chemokine binding that is uncoupled from classic ligand-driven signal transduction
	cascades, resulting instead in chemokine sequestration, degradation, or transcytosis. Also
	known as interceptor (internalizing receptor) or chemokine-scavenging receptor or chemokine
	decoy receptor. Acts as a receptor for chemokines CXCL11 and CXCL12/SDF1. Chemokine
	binding does not activate G-protein-mediated signal transduction but instead induces beta-
	arrestin recruitment, leading to ligand internalization and activation of MAPK signaling pathway.
	Required for regulation of CXCR4 protein levels in migrating interneurons, thereby adapting
	their chemokine responsiveness. In glioma cells, transduces signals via MEK/ERK pathway,
	mediating resistance to apoptosis. Promotes cell growth and survival. Not involved in cell
	migration, adhesion or proliferation of normal hematopoietic progenitors but activated by
	CXCL11 in malignant hemapoietic cells, leading to phosphorylation of ERK1/2
	(MAPK3/MAPK1) and enhanced cell adhesion and migration. Plays a regulatory role in CXCR4-
	mediated activation of cell surface integrins by CXCL12. Required for heart valve development.
	Acts as coreceptor with CXCR4 for a restricted number of HIV isolates.
